

Tracer bullets are used for "Skeleton Applications". For example, connects to the client, connects to the database, queries the database.

You would write a prototype if you wanted to see if your server can handle over 1,000 requests at a time. So you write a script that sends a request to your server 1,000 times.

For the waste collection system, measuring by attaching a distance sensor to a box is a prototype.

Tracer Bullet is the getting of data by adding WiFi module and distance sensor to Arduino.

Orthogonality

A radio where changing the station doesn't change the volume.

Sunrise does not affect raining and vice versa.

The temperature of the water in the thermos does not change with the temperature of the air.
